

Methods and Tools for Management Information Systems

Practise 5

6. Dezember 2010

You are about to describe a (fictional) application in excerpts. It consists of several (at least one) classes and interfaces. Each class consists of at least one method, variables and statics. It returns either a string, an int or a boolean. A PDF documentation exists for each class, it has to be opened with `acroread.exe`. All methods contain an identical version number, which is 1.3 now. Methods, classes and interfaces have a name, an author and a copyright. These are imported from a different DTD. Interfaces are derived from a main interface which has no details.

- Now create the XML schema (xsd) files!
- Deadline: 14.12.2010.
